

Product Spec Sheet
MXC
SEVERE JUNK MILL

MXC Mills are a hybrid of our usual MX mill. Where there are multiple target components or when the target moves and conventional carbide mills dull in less than 30 feet the MXC has been used with good results to cut 100 feet or more when previous mills can't make more than 10-12 feet.

Instead of the usual radial impreg blades of the MX the blades are made up of "Pods" that have a carbide insert at the leading edges of each pod with the rest of the pod being made of the usual diamond grit that is impregnated to the full depth.
